

# Memorandum

To: Bill Bennett (Intuitive Surgical)  
From: Juan Nunez  
Date: 19 November, 2020

**Subject:** Delivery of “Fan Control” Coding Challenge.

## Summary:

The following is a delivery of the Fan Control software component for you and your team's assessment as a part of my interview process.

### Artifacts:

The following artifacts are provided as a part of this delivery:

 <pre> Docs ├── FanControl_DesignDocument.pdf ├── FanControl_Memorandum.pdf └── IntuitiveCodingChallenge_FanControl.docx  _Snapshot_FanControlUI_Exe ├── platforms │   ├── FanControlUI.exe │   ├── Qt5Core.dll │   ├── Qt5Gui.dll │   └── Qt5Widgets.dll ├── FanControlComponent ├── FanControlComponent_Gtest ├── FanControlComponent_Lib ├── FanControlComponent_UI ├── FanControlUI_Exe ├── Build_All.cmd ├── Build_FanControl.cmd ├── Build_FanControl_Gtest.cmd ├── Build_FanControl_Lib.cmd ├── Build_FanControl_UI.cmd └── clean_x64.cmd         </pre>	<ul style="list-style-type: none"> <li>• <b>_Docs:</b> <ul style="list-style-type: none"> <li>○ <b>FanControl_Memorandum.pdf:</b> This document.</li> <li>○ <b>FanControl_DesignDoc.pdf:</b> A simplified design document for the FanControlComponent.</li> <li>○ <b>IntuitiveCodingChallenge_FanControl.docx:</b> Original challenge Instructions.</li> </ul> </li> <li>• <b>_Snapshot_FanControlUI_exe:</b> Folder containing a snapshot of a working FanControl Demo and supporting DLLs.</li> <li>• <b>FanControlComponent:</b> Solution for the stand alone FanControl Component.</li> <li>• <b>FanControlComponent_Gtest:</b> Solution for the FanControl with GTest.</li> <li>• <b>FanControlComponent_Lib:</b> Solution for the FanControl Library.</li> <li>• <b>FanControlComponent_UI:</b> Solution for the QT UI.</li> <li>• <b>FanControlUI_Exe:</b> Folder containing the Demo executable and needed QT DLLs.</li> <li>• <b>Build_All.cmd:</b> Does a full clean and rebuild of both Debug and Release for all the solutions; Also deleting x64 folders.</li> <li>• <b>Build_FanControl.cmd:</b> Builds the Stand Alone FanControl Component as an executable.</li> <li>• <b>Build_FanControl_Lib.cmd:</b> Builds the FanControl Library.</li> <li>• <b>Build_FanControl_UI.cmd:</b> Builds the Demo with QT GUI, essentially building the FanControl library and QT UI. The Executable is copied into the FanControlUI_Exe folder.</li> <li>• <b>Build_FanControl_Gtest.cmd:</b> Builds the Fan Control Component with GTest executable.</li> <li>• <b>clean_x64.cmd:</b> Deletes the various x64 folders created and populated during the build process.</li> </ul>
---	---

## Build Environment:

- Visual Studio 19
  - QT Visual Studio 2019 Tools (Extension)
  - Test Adapter for Google Test (Installer)
- gRPC MSVC142\_64
  - [https://github.com/thommyho/gRPC\\_windows/releases/tag/v1.22.0](https://github.com/thommyho/gRPC_windows/releases/tag/v1.22.0)
  - Unzip under: ..\FanControl\FanControlComponent\gRpc\
- QT 5.15.1
  - <https://www.qt.io/> (Open Source Qt)

## Environment Variables:

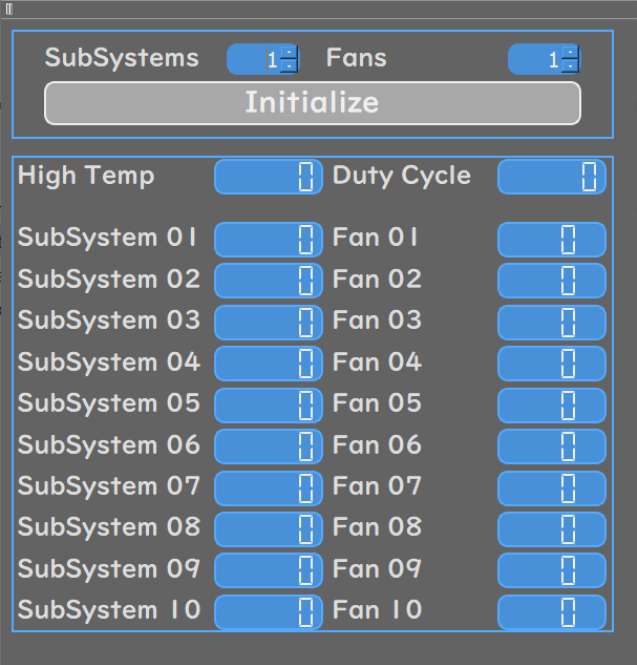

- MSBuild: Ensure the path to MSBuild has been added to the windows PATH environment variable.
  - **Example:** C:\Program Files (x86)\Microsoft Visual Studio\2019\Community\MSBuild\Current\Bin\

## Building:

- With the build environment setup, either open a solution via Visual Studio or run the desired [\*.cmd] command script.

## Fan Control Demo:

The Fan Control Demo exercises the Fan Control Component by instantiating one or more SubSystems which will generate a temperature and send it to the Fan Control Component. The Fan Control Component will keep track of the highest temperature, calculate the base fan duty cycle for the highest temperature and then calculate the specific PWM Count for each fan and finally program the fan with the value.

**Inputs:**

- SubSystems [1:10]: The number of SubSystems to instantiate.
- Fans: [1:10]: The number of Fans to instantiate.

**Note:** The demo randomly assigns the instance number, between [1:10], during instantiation and are not necessarily sequential.

**Button:**

- The single button has 3 functions:
  - **Initialize:** Available only once, instantiates the FanControl Component and SubSystem(s).
  - **Start:** Commands the SubSystem(s) to start generating temperatures.
  - **Stop:** Stops the SubSystem(s).

**Note:** Once initialized, the “Inputs” become disabled.

**Display:**

- High Temp: The current highest temperature.
- Duty Cycle: The base duty cycle base on the High Temp Value.
- SubSystems [1:10]: The current temp for the SubSystem.
- Fan [1:10]: The current PWM Count for the Fan.

## Fan Control Stand Alone:

The Fan Control Component solution is setup to build as an executable, as opposed to a library, which contains a main that is hard-coded to instantiate 10 SubSystems and 10 Fans. Using the Release version, once running, the FanControl will print the current high temperature and the base duty cycle. The Debug version will print the temperatures Fan Control is receiving from the SubSystems.
